

Hierarchy

Time Period: 9 Июнь 2012 г. 14:23:41

Description: This report shows the hierarchical relationship among the SSIDs used in the wireless network and the access points and stations that are using these SSIDs. This report also includes specific device information such as MAC address, Media Type, SSID, Channel, Security settings used and the times when the device was first and last seen by AirMagnet.

A WLAN Access Point has only limited resources and therefore it can service only a limited number of clients. When the limit is reached, additional clients may be rejected in service, or lead to degraded performance for the existing clients. When designing a WLAN equipment deployment and provisioning for service, this limitation should be considered. After deployment, the limitation may be challenged by the growing number of users therefore requires constant monitoring for under-provisioned deployment. This gives great details on the wireless assets and various options for viewing and managing your device hierarchy per access point.
